Thank you for choosing STAINLESS STEEL BRAKES CORPORATION for your braking needs. Please take the time to read and carefully follow these instructions to insure the ease of your installation as well as the proper performance of the complete system.

Before beginning your installation, please verify you have received all the parts indicated on the packing slip. If you believe anything to be missing or incorrect, please call our Customer Service Department at 716-759-8666.

To assure your installation will go safely and smoothly, have the following items on hand to assist you:

- **JACK & JACK STANDS**
- **TORQUE WRENCH**
- **TUBE WRENCHES**
- **MALLET**
- **WHEEL BEARING GREASE**
- **LUG WRENCH**
- **SOCKET SET**
- **WRENCH SET**
- **BRAKE FLUID**
- **BRAKE CLEANER**

These kits use the following pads:

- SSBC#: A1033
- FMSI#: D-11

Revised to level 4 2/28/12
THIS KIT IS DESIGNED FOR CARS WITH V-8 SPINDLES (5-LUG WHEELS) ONLY AND WILL NOT FIT CARS WITH 6 CYLINDER (4-LUG WHEELS) SPINDLES.

TIP: BEFORE BEGINNING INSTALLATION, SPRAY ALL FITTINGS AND FASTENERS WITH PENETRATING OIL.

Front Drum Brake Removal
1) Raise the car until the wheels and tires clear the floor and support the car on jack stands. Remove the wheel covers or hub caps and remove the wheel and tire assemblies from the drums.
2) Remove the grease cap from the hub. Remove the cotter pin, nut lock, adjusting nut, and flat washer from the spindle. Remove the outer bearing.
3) Pull the hub and drum assembly from the spindle. If the brake drum will not come off easily, retract shoes by inserting a narrow screwdriver through the brake adjusting slot in the backing plate and disengage the adjusting lever from the adjusting screw. While holding the adjusting lever away from the adjusting screw, back off the adjuster.
4) Drain system of all the brake fluid as follows:
   a) Remove master cylinder cover. Use a syringe to remove as much fluid from the master cylinder reservoir as possible.
   b) Attach hoses to front bleeder screws and place other end of hose in a container. Open bleeder screw.

BE CAREFUL NOT TO GET BRAKE FLUID ON THE PAINT. IT CAN CAUSE SEVERE DAMAGE!!

c) When fluid stops draining, disconnect the flexible hoses from the rigid brake line at the frame and remove horseshoe clips. Use plenty of penetrating oil between the tube nut and the mating fitting. We strongly recommend the use of a tube wrench available from any tool supply store including Sears.

5) Remove drum brake as follows:
   a) Remove flexible hose from the back of both brake cylinders and remove brake cylinder.
   b) Remove entire drum brake assembly as a unit by removing the four (4) bolts attaching the backing plate to the spindle flange. Discard assembly.

6) Installation of Conversion kit (refer to Figure 1)
   a) Install caliper mounting bracket followed by rotor splash shield (over gasket, if there) on spindle. Make sure mounting bracket bosses face toward inside of car and bracket and shield are for the correct side of car (marked left or right).
   NOTE: Calipers will mount towards front of car.
   b) Attach shield and bracket to spindle with grade 8 bolts supplied in kit from the outside in so the head of the bolt is on the outside. Secure with locknuts and torque to 35-45 ft./lbs.

7) Rotors and Bearings
   a) Remove the protective coating from the new rotor with brake cleaner.
   b) Pack the inner (larger) bearing with wheel bearing grease and place in inner cup (which is already in the rotor assembly). Pack grease lightly between the lips of the grease seal and then install seal. Use a soft mallet or a piece of wood so as not to distort the seal.
c) Install the rotor and hub assembly on the spindle.

d) Pack and install the outer wheel bearing, washer and adjusting nut.

e) The wheel bearing adjustment as follows is especially important with disc brakes: Rotate rotor while torquing spindle nut to 17-25 ft.-lbs. Back off the adjusting nut 1/2 turn and retighten to 10-15 in-lbs. Selectively position nut retainer on adjusting nut so that a set of slots are in line with the cotter pin hole. Adjusting nut should not be rotated during this operation. Lock adjusting nut and retainer with cotter pin, so that cotter pin does not interfere with static collector (if used).

f) Install grease cap being careful not to tap on center of cap with hammer as this can crush cap.

FOR THE BALANCE OF THESE INSTRUCTIONS, BE CAREFUL THAT ALL HYDRAULIC COMPONENTS ARE KEPT CLEAN AND FREE OF DEBRIS INSIDE AND OUT. REMEMBER - DIRT IS THE ENEMY OF HYDRAULIC SYSTEMS, AND WE WILL NOT BE RESPONSIBLE FOR SYSTEM FAILURES DUE TO AN UNCLEAN INSTALLATION!

8) Caliper Installation

a) Place pads in caliper (lining material should face each other). NOTE: Do not spray or brush-on “anti-squeak” compound on pistons or pads. Gasket type materials are also not recommended. Application of these materials defeat the purpose of the caliper design which requires that the pads slide over the pistons during brake application and may cause a brake fluid leak.

b) Install stainless steel pad retaining splash shield and secure the shield to the caliper with the stainless retaining bolts and lock washers supplied. Torque bolts to 7-11 ft./lbs.

c) Install flexible brake lines in the caliper with one copper washer between the hose fitting and the caliper.

d) Install adapter fittings from kit between factory steel lines and flexible brake lines (if there is a size difference).

e) Position the caliper assembly on the rotor and mate the mounting bolt holes in the caliper with the mounting bracket. It may be necessary to push the caliper pistons into the cylinder bores to obtain clearance between the brake pads and the rotor. Assure the pad retaining tabs are seated properly in the caliper.

IF CALIPER DOES NOT SLIDE EASILY INTO PLACE OR DOES NOT LINE UP CORRECTLY WITH MOUNTING BRACKET, MINOR TRIMMING OF THE SPLASH SHIELD MAY BE REQUIRED. IF TRIMMING IS REQUIRED, IT SHOULD ONLY BE DONE ON THE TWO EDGES OF THE SHIELD THAT ARE ADJACENT TO THE CALIPER.

f) Install the caliper mounting bolts and torque to 45-60 ft/lbs. Check to insure that the rotor runs squarely and centrally between the two bosses of the caliper. There should also be approximately 0.090-0.120 inch clearance between the caliper body and the rotor outside diameter. Make sure bleeder screws point up.
g) Attach caliper flex line to frame (12 point bracket) and push horseshoe clip over end of hose to retain it.

h) With both front wheels off the ground, turn wheels through a full left to right turn to insure that the hoses do not twist or take a double bend. If hoses do not bend correctly, remove them from the 12 point bracket and reorient them so that they bend with a minimum of twisting. Failure to complete this part of the installation may cause brake lockup in service since the thin wall interior hose may collapse and restrict the fluid from relieving caliper line pressure when the brake pedal is released.

9) Removal of master cylinder
   a) Disconnect the brake lines at the master cylinder.
   b) Remove the bolts that secure the master cylinder to the booster or the master cylinder to the firewall if no booster is present.
   c) If the car was equipped with a booster, the master cylinder can simply be lifted away. On cars with no booster, the pushrod has to be disconnected from the brake pedal so the master cylinder and push rod can be removed as one unit.

10) Installation of Power Booster and Master Cylinder

THE MASTER CYLINDER MUST BE BENCH BLED BEFORE INSTALLATION. FOR PROPER BENCH BLEEDING PROCEDURE, SEE THE ATTACHED PAGE.

   a) You must drill out the threads in the four holes in the firewall. There is a dimple in the firewall between the two lower holes. This must also be drilled.
   b) You must cut the hole in the firewall larger for the pushrod boot on the booster. Refer to template #1 for measurements.
   c) Bolt the booster and master cylinder assembly to the firewall. Torque to 6-12 ft/lbs.
   d) You can now connect the supplied lines from the master cylinder to the original distribution block.

11) Brake Pedal Installation
   a) Remove old pedal.
   b) Install new pedal in upper hole using supplied hardware. See Figures 3 and 4 for correct positioning of the new pedal.
   c) Connect the pushrod to the new pedal using the supplied bushings and hardware.

12) Proportioning Valve Installation
   a) Locate position of the adjustable proportioning valve on fender wall between distribution block and firewall. (Note: On some cars there will be a window in the fender wall for the original production valve location.)
   b) Install adapter fittings into both ports of proportioning valve.
   c) Bend and install brake line (supplied in kit) from rear distribution block port of (nearest fire wall) to “IN” port of the proportioning valve. Rebend line to rear brakes and connect to “OUT” port of proportioning valve.
13) Filling and Bleeding System
   a) It is advisable to replace the brake fluid if the color is brown or muddy. This is due to water that has been absorbed by the fluid which will eventually corrode the brake lines and master cylinder. This absorbed moisture can also cause a vapor lock situation under extreme braking conditions. Flush system with clean brake fluid and replace with a good grade of disc brake fluid. DOT 3 or DOT 4 fluids are acceptable.
   b) The simplest and most effective way to bleed your brakes is to use the gravity bleeding approach as follows:
      1) With calipers installed, make sure all fittings are tight and master cylinder is topped off.
      2) Open one bleeder screw at a time starting at the wheel farthest from the master cylinder and working your way back around the wheel closest to the master. With bleeder screw open, observe bleeder. At first the fluid will begin to escape with intermittent air bubbles. When the air bubbles stop and a steady flow of fluid is observed for several seconds, close the bleeder valve and move on to the next wheel.

   MAKE SURE TO KEEP A CLOSE WATCH OVER THE FLUID LEVEL INSIDE THE MASTER CYLINDER DURING THE BLEEDING PROCESS. NEVER LET THE RESERVOIR RUN DRY. ALWAYS KEEP IT AT LEAST 1/3 FULL.

      3) After bleeding both wheels and topping of the master cylinder make 20-30 applications of the brake pedal. If a hard pedal is experienced, no further bleeding is required. If pedal is spongy, repeat bleeding process until a hard pedal is achieved.

FINAL INSPECTION
14) Once a hard pedal is achieved, all fittings and connections must be inspected to make sure there are no leaks. Also check the level in both reservoirs of the master cylinder and top off, if needed.
15) Put wheels back on the car and turn wheel by hand to insure that the wheel spins freely and does not interfere with any brake components. If any interferences are detected, DO NOT drive vehicle until problem can be identified and corrected.

   DO NOT DRIVE IN TRAFFIC UNTIL THE BRAKES SAFELY STOP THE CAR A SAFE DISTANCE WITHOUT A SPONGY PEDAL FEEL!

   BRAKING TESTS SHOULD ALWAYS BE DONE IN A SAFE OPEN AREA!

NOTE: For frequently asked questions and technical reference information please visit the tech section of our website at www.ssbrakes.com.

Rear bowl of master cylinder goes to junction block, which then feeds the front brakes.

Front bowl of master cylinder goes to junction block, then goes through proportioning valve, which then feeds the rear brakes.
Typical Brake Line Plumbing Diagram for vehicles without 5 port distribution block

Back bowl of master cylinder goes to junction block, which then feeds the front brakes.

Front bowl of master cylinder goes to proportioning valve, which then feeds the rear brakes.
**How and why do I bench bleed a master cylinder?**

When installing or replacing a master cylinder, it is critical that all air is removed from the master cylinder. This can easily be done by bench bleeding the master cylinder prior to installation. Using the SSBC master cylinder bleeder kit (#0460):

1) Place your master cylinder in a vise by the ears (not body). Make sure it is level.
2) Attach a piece of clear plastic hose to the short end of one of the plastic nozzles. Do the same to the other hose and nozzle.
3) Clip the plastic bridge to the wall and push the ends of the hose through the holes so they are SUBMERGED in the reservoir on either side of the wall.
4) Press the tapered end of the nozzle FIRMLY into the cylinder port hole with a twisting motion. Repeat this procedure on the other port hole.
5) Fill the reservoir with CLEAN brake fluid recommended by the manufacturer.
6) Using full strokes, push the piston in, then release. Do this until ALL the air bubbles have disappeared from the clear plastic hose. **(CAUTION-MASTER CYLINDER WILL NOT BLEED PROPERLY UNLESS HOSES ARE SUBMERGED IN BRAKE FLUID UNTIL THE BLEEDING PROCESS IS COMPLETED.)**

Now mount master cylinder and avoid brake fluid leaking out of front and rear ports during installation.

**Bleeding steps for Dual Port Master Cylinder**

If you have a master cylinder with dual port holes (4 port holes - 2 on each side), it is necessary to bleed both port sides of the master cylinder. If both sides of the master cylinder are not bled, there will be air trapped in the master cylinder and your brakes will not function properly.

To bleed dual port master cylinders:

1) Follow steps 1 - 6 above on the side you will be hooking the brake lines to. Plug the other side.
2) Once the air bubbles are no longer visible in the plastic hose, open the bleeder screws in the supplied plugs and allow the mater cylinder to gravity bleed. **DO NOT** push the master cylinder piston in while the plugs are gravity bleeding.
3) When clear, steady streams of fluid are coming out of both bleeders, close and tighten the bleeders. Give the master cylinder piston several strokes, making sure there are still no bubbles present in the clear plastic tubes.
4) Remove the tubes and plastic fittings and mount the master cylinder on the vehicle being careful not to spill brake fluid on any painted surfaces.
